Amendments to the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A method for managing multiple resources in a system including at least one host, network, and a storage space comprised of at least one storage system that each host is capable of accessing over the network, comprising:

after an initial resource configuration has been established and continually during the operation of the system, measuring and monitoring a plurality of service level parameters parameter values indicating a state of the resources in the system;

determining values for the service level parameters; determining whether the <u>measured</u> service level parameter values satisfy predetermined service level thresholds;

indicating whether the service level parameter values satisfy the predetermined service thresholds; and

determining a <u>corrective</u> modification of one at least one resource deployment or configuration <u>based on the measured service level parameter</u> <u>values</u> when the value for the service level parameter for the resource does not satisfy the predetermined service level thresholds <u>in order to satisfy the</u> predetermined service level thresholds.

- 1 2. (Original) The method of claim 1, wherein the monitored service level parameter comprises one of a performance parameter and an availability level of at least one system resource.
- 1 3. (Previously Presented) The method of claim 2, wherein the service level performance parameters that are monitored are members of a set of

- performance parameters comprising: a downtime during which at least one
 application is unable to access the storage space; a number of times at least one
 application host was unable to access the storage space; a throughput in terms
 of bytes per second transferred between the at least one host and the storage;
 and an I/O transaction rate.
- 4. (Original) The method of claim 1, wherein the modification of resource
 deployment comprises at least one of adding additional instances of the resource
 and modifying a configuration of the resource.
- 1 5. (Previously Presented) The method of claim 1, wherein a time period is
 2 associated with one of the monitored service parameters, further comprising:
 3 determining a time during which the value of the service level parameter
 4 associated with the time period does not satisfy the predetermined service level
 5 threshold; and generating a message indicating that the determined time
 6 exceeds the time period when the determined time exceeds the time period
 7 associated with the monitored service parameter.
- 1 6. (Original) The method of claim 5, wherein a customer contracts with a service
 2 provider to provide the system at agreed upon service level parameters, further
 3 comprising: transmitting a service message to the service provider after
 4 determining that the value of the service level parameter does not satisfy the
 5 predetermined service level; and transmitting the message indicating failure of
 6 the value of the service level parameter for the time period to both the customer
 7 and the service provider.
- 7. (Original) The method of claim 1, further comprising writing to a log information indicating whether the service level parameter values satisfy the predetermined service thresholds.

- 1 8. (Original) The method of claim 1, wherein determining the modification of the at
 2 least one resource deployment further comprises: analyzing the resource
 3 deployment to determine at least one resource that contributes to the failure of
 4 the service level parameter values to satisfy the threshold; determining whether
 5 any additional instances of the determined at least one resource that contributes
 6 to the failure of the service level parameter is available; and allocating at least
 7 one additional instance of the determined at least one resource to the system.
- 1 9. (Original) The method of claim 8, wherein analyzing the resource deployment comprises performing a bottleneck analysis.
- 1 10. (Previously Presented) The method of claim 8, further comprising: determining
 characteristics of access to the resources by applications operating at the service
 level; and when there are no additional instances of the determined at least one
 resource, determining whether the access characteristics exceed predetermined
 access characteristics; and indicating that the service level is not sufficient due to
 a change in the access characteristics.
- 1 11. (Original) The method of claim 10, wherein the access characteristics include 2 read/write ratio, Input/Output (I/O) size, and percentage of access being either 3 sequential or random.
- 1 12. (Original) The method of claim 10, wherein the predetermined access
 2 characteristics are specified in a service level agreement that indicates the
 3 thresholds for the service level parameter values.
- 1 13. (Original) The method of claim 1, wherein a plurality of applications at different service levels are accessing the resources in the system, wherein requests from applications using a higher priority service receive higher priority than requests from applications operating at a lower priority service, wherein determining the modification of the at least one resource deployment further comprises:

- increasing the priority associated with the service level whose service level parameter values fail to satisfy the predetermined service level thresholds.
- (Previously Presented) The method of claim 13, wherein determining the 14. 1 modification of the at least one resource deployment further comprises: analyzing 2 the resource deployment to determine at least one resource that contributes to 3 the failure of the service level parameter values to satisfy the thresholds; 4 determining whether any additional instances of the determined at least one 5 resource that contributes to the failure of the service level parameter is available; 6 and allocating at least one additional instance of the determined at least one 7 resource to the system, wherein the priority is increased when there are no 8 additional instances of the at least one resource that contributes to the failure. 9
- 1 15. (Previously Presented) The method of claim 1, wherein one service level
 2 parameter value indicates a time throughput of Input/Output operations between
 3 the at least one host and the storage space has been below a throughput
 4 threshold, and wherein determining the modification of one at least one resource
 5 deployment or configuration further comprises determining at least one of host
 6 adaptor, network, and storage resources to add to the configuration.
- 1 16. (Previously Presented) The method of claim 1, further comprising: invoking an operation to implement the determined modification of one at least one resource deployment or configuration.
- 1 17. (Previously Presented) The method of claim 1, wherein the service level
 2 parameters specify a predetermined redundancy of resources, further
 3 comprising: detecting a failure of one component; determining whether the
 4 component failure causes the resource deployment to fall below the
 5 predetermined redundancy of resources; and indicating whether the component
 6 failure causes the resource deployment to fall below the predetermined
 7 redundancy threshold.

(Currently Amended) A system for managing multiple resources in a system including at least one host, network, and a storage space comprised of at least one storage system that each host is capable of accessing over the network, comprising:

18.

means, operable after an initial resource configuration has been established and continually during the operation of the system, for measuring and monitoring a plurality of service level parameters parameter values indicating a state of the resources in the system;

means for determining values for the service level parameters; means for determining whether the <u>measured</u> service level parameter values satisfy predetermined service level thresholds;

means for indicating whether the service level parameter values satisfy the predetermined service thresholds; and

means for determining a <u>corrective</u> modification of at least one resource deployment or configuration <u>based on the measured service level parameter</u> <u>values</u> when the value for the service level parameter for the resource does not satisfy the predetermined service level thresholds <u>in order to satisfy the</u> predetermined service level thresholds.

- 19. (Previously Presented) The system of claim 18, wherein the service level performance parameters that are monitored are members of a set of performance parameters comprising: a downtime during which the at least one application is unable to access the storage space; a number of times at least one application was unable to access the storage space; a throughput in terms of bytes per second transferred between the at least one application and the storage; and an I/O transaction rate.
- 1 20. (Original) The system of claim 18, wherein the modification of resource
 2 deployment comprises at least one of adding additional instances of the resource
 3 and modifying a configuration of the resource.

- 1 21. (Previously Presented) The system of claim 18, wherein a time period is
 2 associated with one of the monitored service parameters, further comprising:
 3 means for determining a time during which the value of the service level
 4 parameter associated with the time period does not satisfy the predetermined
 5 service level threshold; and means for generating a message indicating that the
 6 determined time exceeds the time period when the determined time exceeds the
 7 time period associated with the monitored service parameter.
- 22. (Original) The system of claim 18, wherein the means for determining the 1 modification of the at least one resource deployment further performs: analyzing 2 the resource deployment to determine at least one resource that contributes to 3 the failure of the service level parameter values to satisfy the threshold; 4 determining whether any additional instances of the determined at least one 5 resource that contributes to the failure of the service level parameter is available; 6 7 and allocating at least one additional instance of the determined at least one resource to the system. 8
- 1 23. (Previously Presented) The system of claim 22, further comprising: means for
 2 determining characteristics of access to the resources by applications operating
 3 at the service level; means for determining whether the access characteristics
 4 exceed predetermined access characteristics when there are no additional
 5 instances of the determined at least one resource; and means for indicating that
 6 the service level is not sufficient due to a change in the access characteristics.
- 1 24. (Original) The system of claim 18, wherein a plurality of applications at different
 2 service levels are accessing the resources in the system, wherein requests from
 3 applications using a higher priority service receive higher priority than requests
 4 from applications using a lower priority service, wherein determining the
 5 modification of the at least one resource deployment further comprises:

increasing the priority associated with the service level whose service level parameter values fail to satisfy the predetermined service level thresholds.

25. (Currently Amended) A system for managing multiple resources in a system including at least one host, network, and a storage space comprised of at least one storage system that each host is capable of accessing over the network, comprising:

a processing unit;

- a computer readable medium accessible to the processing unit;
 program code embedded in the computer readable medium executed by
 the processing unit to perform:
 - (i) after an initial resource configuration has been established and continually during the operation of the system, measuring and monitoring a plurality of service level parameters parameter values indicating a state of the resources in the system;
 - (ii) determining values for the service level parameters;
 - (iiiii) determining whether the <u>measured</u> service level parameter values satisfy predetermined service level thresholds;
 - (iv) indicating whether the service level parameter values satisfy the predetermined service thresholds; and
 - (<u>viii</u>) determining a <u>corrective</u> modification of at least one resource deployment or configuration <u>based on the measured service level</u> <u>parameter values</u> when the value for the service level parameter for the resource does not satisfy the predetermined service level thresholds <u>in order to satisfy the predetermined service level</u> thresholds.
- 1 26. (Previously Presented) The system of claim 25, wherein the service level
 2 performance parameters that are monitored are members of a set of
 3 performance parameters comprising: a downtime during which the at least one
 4 application is unable to access the storage space; a number of times at least one

- application was unable to access the storage space; a throughput in terms of bytes per second transferred between the at least one application and the storage; and an I/O transaction rate.
- 1 27. (Original) The system of claim 25, wherein the program code for determining the
 2 modification of the resource deployment comprises at least one of adding
 3 additional instances of the resource and modifying a configuration of the
 4 resource.
- 28. (Previously Presented) The system of claim 25, wherein a time period is 1 associated with one of the monitored service parameters, wherein the program 2 3 code is further executed by the processing unit to perform: determining a time during which the value of the service level parameter associated with the time 4 period does not satisfy the predetermined service level threshold; and generating 5 a message indicating that the determined time exceeds the time period when the 6 7 determined time exceeds the time period associated with the monitored service 8 parameter.
- (Original) The system of claim 25, wherein the program code for determining the 29. 1 2 modification of the at least one resource deployment further causes the processing unit to perform: analyzing the resource deployment to determine at 3 least one resource that contributes to the failure of the service level parameter 4 values to satisfy the threshold; determining whether any additional instances of 5 the determined at least one resource that contributes to the failure of the service 6 level parameter is available; and allocating at least one additional instance of the 7 determined at least one resource to the system. 8
- 1 30. (Previously Presented) The system of claim 29, wherein the program code is
 2 further executed by the processing unit to perform: determining characteristics of
 3 access to the resources by applications operating at the service level;
 4 determining whether the access characteristics exceed predetermined access

characteristics when there are no additional instances of the determined at least one resource; and indicating that the service level is not sufficient due to a change in the access characteristics.

32.

- 31. (Original) The system of claim 25, wherein a plurality of applications at different service levels are accessing the resources in the system, wherein requests from applications using a higher priority service receive higher priority than requests from applications using a lower priority service, wherein the program code for determining the modification of the at least one resource deployment further causes the processing unit to perform: increasing the priority associated with the service level whose service level parameter values fail to satisfy the predetermined service level thresholds.
 - (Currently Amended) An article of manufacture including code for managing multiple resources in a system including at least one host, network, and a storage space comprised of at least one storage system that each host is capable of accessing over the network, wherein the code is capable of causing operations comprising:

after an initial resource configuration has been established and continually during the operation of the system, measuring and monitoring a plurality of service level parameters parameter values indicating a state of the resources in the system;

determining values for the service level parameters;

determining whether the <u>measured</u> service level parameter values satisfy predetermined service level thresholds; indicating whether the service level parameter values satisfy the predetermined service thresholds; and

determining a <u>corrective</u> modification of one at least one resource deployment or configuration <u>based on the measured service level parameter</u> <u>values</u> when the value for the service level parameter for the resource does not satisfy the predetermined service level thresholds <u>in order to satisfy the</u> <u>predetermined service level thresholds</u>.

- 1 33. (Original) The article of manufacture of claim 32, wherein the monitored service
 2 level parameter comprises one of a performance parameter and an availability
 3 level of at least one system resource.
- 1 34. (Original) The article of manufacture of claim 33, wherein the service level
 2 performance parameters that are monitored are members of a set of
 3 performance parameters comprising: a downtime during which the at least one
 4 host is unable to access the storage space; a number of times the at least one
 5 host was unable to access the storage space; a throughput in terms of bytes per
 6 second transferred between the at least one host and the storage; and an I/O
 7 transaction rate.
- 1 35. (Original) The article of manufacture of claim 32, wherein the modification of resource deployment comprises at least one of adding additional instances of the resource and modifying a configuration of the resource.
- 1 36. (Previously Presented) The article of manufacture of claim 32, wherein a time
 2 period is associated with one of the monitored service parameters, further
 3 comprising: determining a time during which the value of the service level
 4 parameter associated with the time period does not satisfy the predetermined
 5 service level threshold; and generating a message indicating that the determined
 6 time exceeds the time period when the determined time exceeds the time period
 7 associated with the monitored service parameter.
- 1 37. (Original) The article of manufacture of claim 36, wherein a customer contracts
 2 with a service provider to provide the system at agreed upon service level
 3 parameters, further comprising: transmitting a service message to the service
 4 provider after determining that the value of the service level parameter does not
 5 satisfy the predetermined service level; and transmitting the message indicating

- failure of the value of the service level parameter for the time period to both the customer and the service provider.
- 1 38. (Original) The article of manufacture of claim 32, further comprising writing to a log information indicating whether the service level parameter values satisfy the predetermined service thresholds.
- 39. (Original) The article of manufacture of claim 32, wherein determining the 1 modification of the at least one resource deployment further comprises: analyzing 2 the resource deployment to determine at least one resource that contributes to 3 the failure of the service level parameter values to satisfy the threshold; 4 determining whether any additional instances of the determined at least one 5 resource that contributes to the failure of the service level parameter is available; 6 and allocating at least one additional instance of the determined at least one 7 resource to the system. 8
- 1 40. (Original) The article of manufacture of claim 39, wherein analyzing the resource deployment comprises performing a bottleneck analysis.
- 1 41. (Previously Presented) The article of manufacture of claim 39, further comprising:
 2 determining characteristics of access to the resources by applications operating
 3 at the service level; and when there are no additional instances of the determined
 4 at least one resource, determining whether the access characteristics exceed
 5 predetermined access characteristics; and indicating that the service level is not
 6 sufficient due to a change in the access characteristics.
- 1 42. (Original) The article of manufacture of claim 41, wherein the access
 2 characteristics include read/write ratio, Input/Output (I/O) size, and a percentage
 3 of access being either sequential or random.

- 1 43. (Original) The article of manufacture of claim 41, wherein the predetermined 2 access characteristics are specified in a service level agreement that indicates 3 the thresholds for the service level parameter values.
- 44. (Original) The article of manufacture of claim 32, wherein a plurality of 1 applications at different service levels are accessing the resources in the system, 2 wherein requests from applications using a higher priority service receive higher 3 priority than requests from applications operating at a lower priority service, 4 wherein determining the modification of the at least one resource deployment 5 further comprises: increasing the priority associated with the service level whose 6 service level parameter values fail to satisfy the predetermined service level 7 8 thresholds.
- 45. (Previously Presented) The article of manufacture of claim 44, wherein 1 determining the modification of the at least one resource deployment further 2 comprises: analyzing the resource deployment to determine at least one 3 resource that contributes to the failure of the service level parameter values to 4 satisfy the thresholds; determining whether any additional instances of the 5 determined at least one resource that contributes to the failure of the service 6 level parameter is available; and allocating at least one additional instance of the 7 determined at least one resource to the system, wherein the priority is increased 8 when there are no additional instances of the at least one resource that 9 contributes to the failure. 10
- 1 46. (Previously Presented) The article of manufacture of claim 32, wherein one
 2 service level parameter value indicates a time throughput of Input/Output
 3 operations between the at least one host and the storage space has been below
 4 a throughput threshold, and wherein determining the modification of one at least
 5 one resource deployment or configuration further comprises determining at least
 6 one of host adaptor, network, and storage resources to add to the configuration.

- 1 47. (Previously Presented) The article of manufacture of claim 32, further comprising: 2 invoking an operation to implement the determined modification of one at least 3 one resource deployment or configuration.
- 1 48. (Previously Presented) The article of manufacture of claim 32, wherein the
 2 service level parameters specify a predetermined redundancy of resources,
 3 further comprising: detecting a failure of one component; determining whether
 4 the component failure causes the resource deployment to fall below the
 5 predetermined redundancy of resources; and indicating whether the component
 6 failure causes the resource deployment to fall below the predetermined
 7 redundancy threshold.
